

Hire Lens

Cloud Computing Project Presentation

Mohammed Zaid Shaikh Piotr Bartosiewicz Krzysztof Krawiec

April 2026

Agenda

- 1 Project Overview
- 2 Solution Design
- 3 Delivery

The Problem

Hire Lens helps HR teams screen candidates faster by turning public GitHub activity into a structured review and a job-match summary.

The first release stays practical, explainable, and cheap to run while leaving room for AI-assisted ranking later.

Primary Users

- ▶ Recruiters
- ▶ Team leads
- ▶ Platform admins

What Hire Lens Does

- ① Accepts a GitHub username or profile link through Telegram.
- ② Collects public signals such as repositories, languages, activity, and followers.
- ③ Produces a concise candidate summary and later a job-description comparison.
- ④ Stores reports so recruiters can revisit and shortlist candidates.
- ⑤ Enforces basic usage limits and prepares the path for paid tiers.

Design Choice

Telegram stays the main interface; a small dashboard is optional, not central.

Architecture at a Glance

- ▶ Telegram bot as the frontend
- ▶ Azure Functions for API and webhook handling
- ▶ Azure Container Apps for the self-hosted model service
- ▶ Cosmos DB and Blob Storage for data
- ▶ Service Bus for asynchronous jobs

Request Flow

- 1 Recruiter sends a GitHub profile.
- 2 Bot triggers analysis through Azure Functions.
- 3 Public data is enriched and summarized.
- 4 Results are stored and returned in Telegram.

Storage and Infrastructure

Storage

- ▶ Cosmos DB for users, sessions, reports, and limits
- ▶ Blob Storage for exports and cached snapshots
- ▶ Optional SQL/Table storage for audit and billing records

Terraform

- ▶ Separate modules for functions, data, messaging, and monitoring
- ▶ Dev first, then prod

Risks and Mitigations

- ▶ GitHub API limits: reduce calls with caching and queueing.
- ▶ AI quality: keep a deterministic fallback summary path.
- ▶ Hosting cost: start with a smaller quantized model and strict rate limits.
- ▶ OAuth complexity: begin with one provider, then expand.
- ▶ External costs: prefer the cheapest practical Azure region and usage caps.

Team Split and Milestones

Responsibilities

- ▶ Mohammed Zaid Shaikh: bot flow and UX
- ▶ Piotr Bartosiewicz: analysis logic and APIs
- ▶ Krzysztof Krawiec: Terraform, deployment, monitoring

Milestones

- 1 Telegram login and profile analysis
- 2 Report storage and retrieval
- 3 Job matching and usage limits
- 4 Terraform deployment and demo

Hire Lens is intentionally small in the first release: one bot, one backend, managed Azure services, and a clear path to AI-assisted hiring support.
